Abstract

The recent international events had a large impact on the aviation sector because of several reasons. This documentation is all about the user interface wireframe, here the home page of our flight fare prediction project is explained with proper input.

1. Web Interface

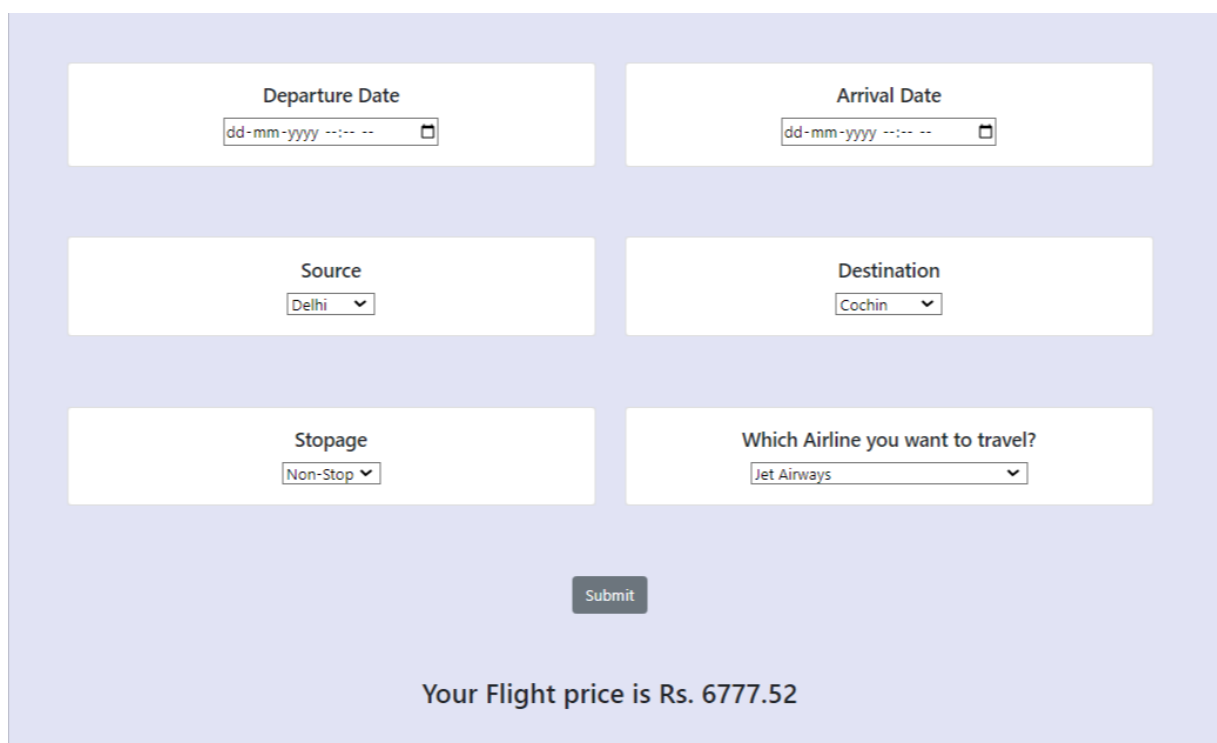

- Our web page is an interface where input is taken from the user and the prediction is displayed.

The screenshot displays a web interface for flight booking. It features six input fields arranged in a 3x2 grid. The first row contains 'Departure Date' and 'Arrival Date', both with date pickers showing 'dd-mm-yyyy --:-- --'. The second row contains 'Source' (set to 'Delhi') and 'Destination' (set to 'Cochin'). The third row contains 'Stopage' (set to 'Non-Stop') and 'Which Airline you want to travel?' (set to 'Jet Airways'). Below these fields is a 'Submit' button. At the bottom, the text 'Your Flight price is Rs. 6777.52' is displayed.

2. User Input

- Whenever the user hits our url, they first see the user input page here they have to provide the information like:
 - Every user input has its own dropdown where the user can select their input.
 - After providing the required input and pressing the submit button, the page refreshes and displays the output

This screenshot is identical to the one above, showing the same web interface with flight input fields and the displayed price of Rs. 6777.52.

3. Result Page

After the user hits the submit button the page gets refreshed and the results are being displayed in the highlighted area in the above frame.

The user can refill all the inputs in the same page and get the results in the same way.
